ESCORT User Administration Software

User Admin Package is an easy-to-use, Windows™- based software application which is used in conjunction with ESCORT Console software and assists organisations in complying with the US FDA Title 21 CFR Part 11.

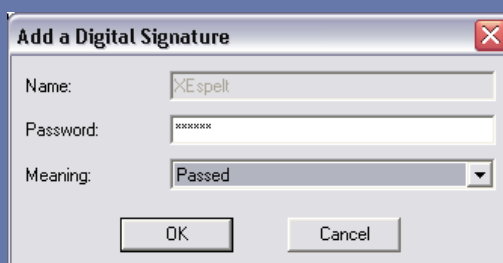

User Admin Package is a stand alone software package, which can be installed on a server, thus restricting access to a server administrator level. The user database contains all the options necessary to establish unique electronic signatures and file tracking as required by FDA Title 21 CFR Part 11.

User Admin Package provides users with the ability to create a database of Console users on a network or single PC. Users then have access to the User Login and Electronic Signature features available within ESCORT Console software.

Due to the high levels of security required for FDA Title 21 CFR Part 11 compliance, the ideal setup for the User Admin Package is in a network environment with general user administration in place.

A list of all of a logger files digital signatures is provided accompanied by the creation time and date of the digital signature

Assigning a digital signature to a logger file is as easy as entering a valid password and selecting the signature meaning from the drop down box provided

The User Administration Package administrator has the ability to create new users, create signature meanings and assign meanings to individual users.
